Preface	ix
1. Introduction	1
1.1 Models and Theories in Science	1
1.2 Why Quantitative Modeling?	3
1.3 Quantitative Modeling in Cognition	5
1.3.1 Models and Data	5
1.3.2 From Ideas to Models	8
1.3.3 Summary	10
1.4 The Ideas Underlying Modeling and Its Distinct Applications	10
1.4.1 Elements of Models	10
1.4.2 Data Description	11
1.4.3 Process Characterization	16
1.4.4 Process Explanation	19
1.4.5 Classes of Models	25
1.5 What Can We Expect From Models?	25
1.5.1 Classification of Phenomena	25
1.5.2 Emergence of Understanding	26
1.5.3 Exploration of Implications	27
1.6 Potential Problems	28
1.6.1 Scope and Testability	28
1.6.2 Identification and Truth	32
2. From Words to Models: Building a Toolkit	35
2.1 Working Memory	35
2.1.1 The Phonological Loop	36
2.1.2 Theoretical Accounts of the Word Length Effect	37
2.2 The Phonological Loop: 144 Models of Working Memory	39
2.2.1 Decay Process	40
2.2.2 Recall Process	41
2.2.3 Rehearsal	41

2.3	Building a Simulation	42
2.3.1	MATLAB	42
2.3.2	The Target Methodology	43
2.3.3	Setting Up the Simulation	44
2.3.4	Some Unanticipated Results	49
2.3.5	Variability in Decay	51
2.4	What Can We Learn From These Simulations?	53
2.4.1	The Phonological Loop Model Instantiated	53
2.4.2	Testability and Falsifiability	54
2.4.3	Revisiting Model Design: Foundational Decisions	55
2.5	The Basic Toolkit	56
2.5.1	Parameters	57
2.5.2	Discrepancy Function	61
2.5.3	Parameter Estimation and Model-Fitting Techniques	63
2.6	Models and Data: Sufficiency and Explanation	64
2.6.1	Sufficiency of a Model	65
2.6.2	Verisimilitude Versus Truth	67
2.6.3	The Nature of Explanations	68
3.	Basic Parameter Estimation Techniques	71
3.1	Fitting Models to Data: Parameter Estimation	71
3.1.1	Visualizing Modeling	72
3.1.2	An Example	74
3.1.3	Inside the Box: Parameter Estimation Techniques	82
3.2	Considering the Data: What Level of Analysis?	96
3.2.1	Implications of Averaging	97
3.2.2	Fitting Individual Participants	100
3.2.3	Fitting Subgroups of Data	103
3.2.4	Fitting Aggregate Data	103
3.2.5	Having Your Cake and Eating It: Multilevel Modeling	104
3.2.6	Recommendations	105
4.	Maximum Likelihood Estimation	109
4.1	Basics of Probabilities	110
4.1.1	Defining Probability	110
4.1.2	Properties of Probabilities	111
4.1.3	Probability Functions	112
4.2	What Is a Likelihood?	117
4.2.1	Inverse Probability and Likelihood	124
4.3	Defining a Probability Function	125
4.3.1	Probability Functions Specified by the Psychological Model	126
4.3.2	Probability Functions via Data Models	127

4.3.3	Two Types of Probability Functions	132
4.3.4	Extending the Data Model	133
4.3.5	Extension to Multiple Data Points and Multiple Parameters	136
4.4	Finding the Maximum Likelihood	138
4.5	Maximum Likelihood Estimation for Multiple Participants	142
4.5.1	Estimation for Individual Participants	143
4.5.2	Estimating a Single Set of Parameters	143
4.6	Properties of Maximum Likelihood Estimators	145
5.	Parameter Uncertainty and Model Comparison	149
5.1	Error on Maximum Likelihood Estimates	150
5.1.1	Standard Errors Across Participants	150
5.1.2	Curvature of the Likelihood Surface	153
5.1.3	Bootstrapping	163
5.1.4	What Do Confidence Limits Tell Us?	170
5.2	Introduction to Model Selection	170
5.3	The Likelihood Ratio Test	177
5.4	Information Criteria and Model Comparison	179
5.4.1	Kullback-Leibler Distance and Akaike's Information Criterion	179
5.4.2	Bayesian Information Criterion	183
5.4.3	Model Comparison With the AIC and BIC	184
5.4.4	An Example of Model Comparison Using AIC and BIC	189
5.4.5	Choosing Between AIC and BIC	191
5.5	Conclusion	192
6.	Not Everything That Fits Is Gold: Interpreting the Modeling	197
6.1	Psychological Data and the Very Bad Good Fit	198
6.1.1	Overfitting	198
6.1.2	Generalizability Versus Goodness of Fit	200
6.2	Parameter Identifiability and Model Testability	204
6.2.1	Identifiability	205
6.2.2	Testability	211
6.2.3	Putting It All Together: Deciding the Identifiability and Testability of a Model	212
6.2.4	Models That Are Identifiable but Not Testable	213
6.3	Drawing Lessons and Conclusions From Modeling	219
6.3.1	Explorations of a Model: Effects of Parameters	220
6.3.2	Demonstrations of Sufficiency	222
6.3.3	Demonstrations of Necessity	226
6.3.4	Summary	232

7. Drawing It All Together: Two Examples	235
7.1 WITNESS: Simulating Eyewitness Identification	235
7.1.1 WITNESS: Architecture	236
7.1.2 WITNESS and Verbal Overshadowing	238
7.1.3 WITNESS in MATLAB	240
7.1.4 WITNESS Simulation Results	252
7.2 Exemplar Versus Boundary Models: Choosing Between Candidates	257
7.2.1 Models of Categorization	258
7.2.2 A Probabilistic Feedback Experiment	263
7.2.3 MATLAB Code for ML Parameter Estimation for GCM, DEM, and GRT	265
7.2.4 Fitting the Models to Data	269
7.2.5 What Have We Learned About Categorization?	279
7.3 Conclusion	281
8. Modeling in a Broader Context	283
8.1 Bayesian Theories of Cognition	284
8.2 Neural Networks	288
8.2.1 Basic Architecture and Operation	288
8.2.2 Hebbian Models	290
8.2.3 Backpropagation Models	293
8.2.4 Summary	297
8.3 Neuroscientific Modeling	298
8.3.1 The Allure of Neuroscience	299
8.3.2 The True Promise of Neuroscience	303
8.4 Cognitive Architectures	306
8.4.1 Cognitive Architectures: Convergence to a Standard	307
8.4.2 Cognitive Architectures: Successes, Problems, and Solutions	308
8.4.3 Marrying Architectures and Neuroscience	310
8.4.4 Architectures and Models	311
8.5 Conclusion	313
8.5.1 Memory	314
8.5.2 Language	314
8.5.3 Perception and Action	315
8.5.4 Choice and Decision Making	315
8.5.5 Identification and Categorization	316
